Project Description

A community bulletin board where users post sticky notes voicing complaints about the effects of AI. The board is styled to resemble a physical corkboard, with colorful, visually distinct notes. Users can upvote or downvote notes, which determines display order: top-rated notes appear first, followed by remaining notes from oldest to newest. New notes are added to the bottom of the board where users can navigate using hover scroll. A sort function (by recency or popularity) and keyword search are also included.

Target Users and Goals

The bulletin board is built for the general public, with a focus on younger users. The goal is to give people a shared space to voice concerns about artificial intelligence and have those perspectives seen and engaged with by a broader community.

Core Features

- Create, edit, and delete sticky notes
- Top banner with rotating showcase of highest-rated notes
- Main bulletin board displayed as a virtual corkboard that expands dynamically as notes are added
- Thumbs-up/thumbs-down voting system that influences note display order
- Display order: top-rated notes first, remaining notes sorted oldest to newest
- Keyword search across all notes
- Sorting and filtering by recency, popularity, or topic

Backend

We plan to mock our data for the backend and will not implement a real data processing system.

Project Scope

This is a frontend-only project with no working backend, authentication, or real-time functionality. The platform is built for general community use, centered on basic note management and a simple popularity system. Features such as commenting, advanced search, and persistent data storage are outside the scope of this project.

Acknowledging AI Technologies

This document was revised with the support of Claude. The authors used the tool to improve wording, but all project-specific content and final decisions were made and reviewed by the team.
